1 Detailed Experiment Settings

Statistics	Agriculture	Art	Legal	Mix	News
Total Tokens	1,923,158	3,581,243	4,719,597	602,561	1,409,743
Total Chunks	1,838	3,414	5,424	596	1,614

Table 1: The detailed statistics of the five datasets.

Datasets Statistics In the QFS task, we choose a total of five datasets for evaluating the FG-RAG. The total number of tokens and the number of chunks partitioned into each dataset are summarized in Table 1.

In the multi-hop QA task, we choose the News dataset with multi-hop QA. Given the extensive collection of QA pairs in the multi-hop QA, we opted for a random selection of 125 pairs from each category—namely, inference, comparison, and temporal queries—for our evaluation process. The details of the three types of queries are described below:

- **Inference query** These queries are developed by integrating the various descriptions of the bridge-entity from multiple claims, ultimately leading to the identification of the entity itself.
- **Comparison query** These queries are crafted to highlight the similarities and differences concerning the bridge entity or topic, with the answer usually being a clear “yes” or “no” based on the comparative analysis.
- **Temporal query** These queries examine the sequence of events at different points in time, with answers typically being a “yes” or “no”, or a single temporal indicator such as “before” or “after”.

Implementation Details The chunk size for all datasets is standardized at 1200 tokens, with a 100-token overlap between consecutive chunks. In addition, the gleaning parameter is fixed to 1 for all GraphRAG-based methods that need to extract entities and relationships from the dataset.

Evaluation Details In the QFS task, we use the evaluation method presented in LightRAG [Guo *et al.*, 2024] to compare the answers given by different methods, and the LLM used in the evaluation process is gpt-4o-mini. We alternate the placement of the two answers in the prompt when comparing the answers given by two methods and calculate win rates accordingly. Specifically, we will treat the answer given

by a method as Answer 1 and Answer 2 respectively at one time, thus ensuring fair comparisons and minimizing possible bias due to the order in the prompt. In the multi-hop QA task, we judge an answer to be correct when and only when it is identical to the standard answer ignoring case.

2 Detailed Experiment Results

In this paper, when assessing the performance of the QFS task, we initially display the average performance of each model across all datasets. To gain a more detailed understanding of how FG-RAG’s performance compares with other baselines across various datasets, in Table 2 we present specific experimental results for each dataset. In addition to the baselines mentioned in the paper, we also made a comparison with FastGraphRAG. It is a graph-enhanced RAG system integrates graph structure with vector representation, utilizing the PageRank algorithm for graph retrieval to enhance the accuracy and reliability of information retrieval. However, due to the outputs of certain LLMs, like qwen2.5-7b-instruct, failing to meet FastGraphRAG’s strict formatting requirements, we are only able to get its response to the query when using gpt-4o-mini.

Table 2: Comparison of FG-RAG's win rate with other baselines across LLMs, metrics, and datasets.

-Goal-
Given a passage of problem text, identify as many entities as possible. Output directly without explanation.

-Steps-
1. Identify as many entities as possible. For each identified entity, extract the following information:
- **entity_name**: Name of the entity.
2. Output all entities identified in step 1 separated by newlines. Output directly without explanation.

Example 1:
Text: What frameworks for character analysis can be employed to interpret the depth of character relationships presented?
Output:
frameworks
character analysis
depth
character relationships

Example 2:
Text: Who is the individual associated with the cryptocurrency industry facing a criminal trial on fraud and conspiracy charges?
Output:
individual
cryptocurrency industry
criminal trial
fraud charges
conspiracy charges

-Real Data-
Text: {input_query}
Output:

Query Entity Extraction

Figure 1: Prompts for query entities extraction.

-Goal-
Given a passage of problem text, identify as many entities as possible. Output directly without explanation.

-Steps-
1. Identify as many entities as possible. For each identified entity, extract the following information:
- **entity_name**: Name of the entity.
2. Output all entities identified in step 1 separated by newlines. Output directly without explanation.

.....

-Real Data-
Text: {input_query}
Output:

Query Entity Extraction

What do you need to know about the {entity_name} to fully answer this question? Just give what you want to know in the form of up to {max_question_number} questions. Ask directly without explanation.

Question Formulation

Figure 2: Prompts for relevant questions formulation.

-Goal-
Generate a response of the target format that around the entity {entity_name}, summarizing all given information for the response format, with the response being as relevant as possible to the given questions, and incorporating any relevant general knowledge. Do not include information where the supporting evidence for it is not provided.

-Target response format-
Multiple Paragraphs

-Given infomation-
{input_descriptions}

-Given questions-
{input_questions}

Add sections and commentary to the response as appropriate for the format. Style the response in markdown.

Summaries Generation

Figure 3: Prompts for summaries generation.

3 Overview of the Prompts Used in FG-RAG

3.1 Prompts for query entities extraction

The prompt in Figure 1 instructs the LLM to extract entities from the query. To prevent the LLM from overlooking key entities in queries during entity extraction, we apply few-shot prompting.

3.2 Prompts for relevant questions formulation

The prompt in Figure 2 instructs the LLM to ask relevant questions around a particular entity. Assuming that the query entity extracted in the entities extraction phase are $\{E_1, E_2, \dots, E_n\}$, we direct the LLM to ask a certain number of questions around the query entity E_i based on the context of the query entity extraction step.

3.3 Prompts for summaries generation

The prompt in Figure 3 instructs the LLM to generate a summary based on the retrieved content around a particular entity and some questions related to the entity. The generated summary consists of multiple paragraphs and is output as mark-down in sections.

3.4 Other prompts

Prompts used in other steps such as extracting entities and their relationships from text chunks, QFS task question generation, and evaluation of answer pairs are similar to those used in LightRAG [Guo *et al.*, 2024] and are not repeated here.

4 Case Studies Comparing FG-RAG with Other Baselines

In order to visualize the superiority of FG-RAG over other baselines in terms of comprehensiveness, diversity, and empowerment, we present some case studies. Table 3, Table 4, Table 5, and Table 6 show the answers given by FG-RAG compared to NaiveRAG [Gao *et al.*, 2023], LightRAG [Guo *et al.*, 2024], GraphRAG [Edge *et al.*, 2024], and Fast-GraphRAG in solving a complex query about how artistic crossovers affect political and social relations, respectively.
